The current update of the ACC/AHA/NASPE Guidelines for Implantation of Cardiac Pacemakers and Antiarrhythmia Devices includes several significant changes in the recommendations and in the supporting narrative portion. In this summary, we list the updated recommendations along with the respective 1998 recommendations, each one accompanied by a brief comment outlining the rationale for the changes, additions, or deletions. All new or revised recommendations are listed in the second column and appear in boldface type. References that support either the 1998 recommendations that have not changed or the new or revised recommendations are noted in parentheses at the end of each recommendation. The reader is referred to the full-text version of the guidelines posted on the American College of Cardiology (ACC), American Heart Association (AHA), and North American Society for Pacing and Electrophysiology (NASPE) World Wide Web sites for a more detailed exposition of the rationale for these changes. In addition to the recommendation changes listed here, this update includes an expanded section on the selection of pacemakers and implantable cardioverter-defibrillators (ICDs) that reflects the technical advances that have taken place since 1998. A brief expanded summary of pacemaker follow-up procedures is also new to these guidelines. For both of these expanded sections, the reader is referred to the online full-text version.
In preparing this update, the committee was guided by the following principles:

(1) Changes in recommendations and levels of evidence were made either because of new randomized trials or because of the accumulation of new clinical evidence and the development of clinical consensus.

(2) The committee is cognizant of the healthcare, logistic, and financial implications of recent trials and factored in these considerations in arriving at the class level of certain recommendations.

(3) Minor wording changes were made to render some recommendations more precise.

(4) The committee wishes to re-emphasize that the recommendations in the guideline apply to most patients but may require modification by existing situations that only the primary treating physician can evaluate properly.

(5) All of the listed recommendations for implantation of a device presume the absence of inciting causes that may be eliminated without detriment to the patient (eg, nonessential drug therapy).

(6) The committee endeavored to maintain consistency of recommendations in this and other previously published guidelines. In the section on atrioventricular (AV) block associated with acute myocardial infarction (AMI), the recommendations follow closely those in the ACC/AHA Guideline for the Management of Patients With Acute Myocardial Infarction. However, given the rapid evolution of pacemaker/ICD science, it has not always been possible to maintain consistency with other guidelines. An example of such a discrepancy can be found in Section I-H, in which the recommendation for biventricular pacing in selected patients with heart failure has been listed under Class IIa, whereas in the ACC/AHA Guideline for the Evaluation and Management of Chronic Heart Failure in the Adult, biventricular pacing is cited as an investigational procedure.

The ACC/AHA classifications I, II, and III are used to summarize indications as follows:

**Class I:** Conditions for which there is evidence and/or general agreement that a given procedure or treatment is useful and effective.

**Class II:** Conditions for which there is conflicting evidence and/or a divergence of opinion about the usefulness/efficacy of a procedure or treatment.

- **IIa:** Weight of evidence/opinion is in favor of usefulness/efficacy.
- **IIb:** Usefulness/efficacy is less well established by evidence/opinion.

**Class III:** Conditions for which there is evidence and/or general agreement that the procedure/treatment is not useful/effective and in some cases may be harmful.

The weight of the evidence was ranked highest (A) if the data were derived from multiple randomized clinical trials that involved large numbers of patients and intermediate (B) if the data were derived from a limited number of randomized trials that involved small numbers of patients or from careful analyses of nonrandomized studies or observational registries. A lower rank (C) was given when expert consensus was the primary basis for the recommendation.

**Class I**

1. Third-degree AV block at any anatomic level, associated with any of the following conditions:
   - a. Bradycardia with symptoms presumed to be due to AV block. *(Level of Evidence: C)*
   - b. Arrhythmias and other medical conditions that require drugs that result in symptomatic bradycardia. *(Level of Evidence: C)*
   - c. Documented periods of asystole greater than or equal to 3.0 seconds or any escape rate less than 40 beats per minute (bpm) in awake, symptom-free patients. *(Level of Evidence: B, C)*
   - d. After catheter ablation of the AV junction. *(Level of Evidence: B, C)* There are no trials to assess outcome without pacing, and pacing is virtually always planned in this situation unless the operative procedure is AV junction modification.
   - e. Postoperative AV block that is not expected to resolve. *(Level of Evidence: C)*

**Class II**

1. Third-degree and advanced second-degree AV block at any anatomic level, associated with any of the following conditions:
   - a. Bradycardia with symptoms (including heart failure) presumed to be due to AV block. *(Level of Evidence: C)*
   - b. (No change)
   - c. Documented periods of asystole greater than or equal to 3.0 seconds (3) or any escape rate less than 40 beats per minute (bpm) in awake, symptom-free patients (4,5). *(Levels of Evidence: B, C)*
   - d. After catheter ablation of the AV junction. *(Levels of Evidence: B, C)* There are no trials to assess outcome without pacing, and pacing is virtually always planned in this situation unless the operative procedure is AV junction modification (6,7).
   - e. Postoperative AV block that is not

**Class III**

The changes emphasize the importance of the site of the block and introduce “advanced second-degree AV block” as a class I indication. This recommendation is based on several observational studies and is supported by a wealth of clinical experience. The narrative portion of this section also emphasizes that the site of origin of the escape rhythm in cases of advanced AV block is as important (or more important) than the escape rate itself.

In recommendation 1a, heart failure is specifically introduced as a major symptom that merits consideration when dealing with AV block-induced bradycardia.

In recommendation 1e, “cardiac surgery” was added to specifically define the situation(s) in which this recommendation applies.

Recommendation 1f has been amplified to indicate that pacing therapy is recommended in patients with neuromuscular diseases and...

<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Neuromuscular diseases with AV block such as myotonic muscular dystrophy, Kearns-Sayre syndrome, Erb's dystrophy (limb-girdle), and peroneal muscular atrophy. (Level of Evidence: B)</td>
<td>expected to resolve after cardiac surgery. (Level of Evidence: C) (8–10)</td>
<td>third-degree AV block whether or not they are symptomatic, in view of the unpredictable progression of AV conduction in this group of diseases.</td>
</tr>
<tr>
<td>2. Second-degree AV block regardless of type or site of block, with associated symptomatic bradycardia. (Level of Evidence: B) (18)</td>
<td>No change</td>
<td></td>
</tr>
</tbody>
</table>

**Class IIa**

1. Asymptomatic third-degree AV block at any anatomic site with average awake ventricular rates of 40 bpm or faster. (Level of Evidence: B, C)

2. Asymptomatic type II second-degree AV block. (Level of Evidence: B)

3. Asymptomatic type I second-degree AV block at intra- or infra-His levels found incidentally at electrophysiological study performed for other indications. (Level of Evidence: B)

4. First-degree AV block with symptoms suggestive of pacemaker syndrome and documented alleviation of symptoms with temporary AV pacing. (Level of Evidence: B)

**Class IIb**

1. Marked first-degree AV block (more than 0.30 seconds) in patients with LV dysfunction and symptoms of congestive heart failure in whom a shorter AV interval results in hemodynamic improvement, presumably by decreasing left atrial filling pressure. (Level of Evidence: C) (24)

2. Neuromuscular diseases such as myotonic muscular dystrophy, Kearns-Sayre syndrome, Erb's dystrophy (limb-girdle), and peroneal muscular atrophy with any degree of AV block (including first-degree AV block) with or without symptoms, because there may be unpredictable progression of AV conduction disease. (Level of Evidence: B) (11–17)

**Class IIa**

1. Asymptomatic third-degree AV block at any anatomic site with average awake ventricular rates of 40 bpm or faster especially if cardiomegaly or left ventricular (LV) dysfunction is present. (Levels of Evidence: B, C)

2. Asymptomatic type II second-degree AV block with a narrow QRS. When type II second-degree AV block occurs with a wide QRS, pacing becomes a Class I recommendation (see next section regarding Pacing for Chronic Bifascicular and Trifascicular Block). (Level of Evidence: B) (19,20)

3. Asymptomatic type I second-degree AV block at intra- or infra-His levels found at electrophysiological study performed for other indications. (Level of Evidence: B) (19–21)

4. First- or second-degree AV block with symptoms similar to those of pacemaker syndrome. (Level of Evidence: B) (22,23)

**Class IIb**

1. Neuromuscular diseases such as myotonic muscular dystrophy, Kearns-Sayre syndrome, Erb's dystrophy (limb-girdle), and peroneal muscular atrophy with any degree of AV block (including first-degree AV block) with or without symptoms, because there may be unpredictable progression of AV conduction disease. (Level of Evidence: B) (11–17)

**Class IIa**

This change introduces the concept that cardiomegaly and LV dysfunction are important considerations in the decision-making process to implant a pacemaker in asymptomatic patients with third-degree AV block and otherwise “acceptable” heart rates.

Based on reports and clinical experience, the change in this recommendation calls attention to the site of the block and emphasizes that a wide QRS complex in patients with type II second-degree AV block suggests the presence of diffuse conduction system disease and constitutes an indication for pacing therapy even in asymptomatic patients.

Minor wording change deleting an unnecessary word (incidentally)

Wording change to clarify that symptoms resulting from first- or second-degree AV block may be similar to those of the pacemaker syndrome rather than suggestive of this syndrome per se.

No change

New recommendation for pacemaker insertion in patients with neuromuscular diseases and second- or first-degree AV block, ie, lesser degrees of AV block than those listed under Class I recommendation 1f.
### 1998 Recommendation

#### Class III

1. Asymptomatic first-degree AV block. *(Level of Evidence: B) (25)*

2. Asymptomatic type I second-degree AV block at the supra-His (AV node) level or not known to be intra- or infra-Hisian. *(Level of Evidence: B, C) (18)*

3. AV block expected to resolve and unlikely to recur (eg, drug toxicity, Lyme disease). *(Level of Evidence: B)*

#### 2002 New or Revised Recommendations

#### Class III

1. Asymptomatic first-degree AV block. *(Level of Evidence: B) (25)*

2. Asymptomatic type I second-degree AV block at the supra-His (AV node) level or not known to be intra- or infra-Hisian. *(Level of Evidence: B, C) (18)*

3. AV block expected to resolve and unlikely to recur (eg, drug toxicity, Lyme disease, or during hypoxia in sleep apnea syndrome in absence of symptoms) *(Level of Evidence: B)*

#### Comments

No change

Addition of hypoxia occurring during periods of sleep apnea as a cause of transient AV block that is unlikely to recur once sleep apnea syndrome has been treated.

### SECTION I-B: PACING FOR CHRONIC BIFASCICULAR AND TRIFASCICULAR BLOCK

#### Recommendations for Permanent Pacing in Chronic Bifascicular and Trifascicular Block

#### Class I

1. Intermittent third-degree AV block. *(Level of Evidence: B) (27–33)*

2. Type II second-degree AV block. *(Level of Evidence: B) (34–36)*

3. Alternating bundle-branch block. *(Level of Evidence: C) (37)*

#### Class IIa

1. Sycope not proved to be due to AV block when other likely causes have been excluded, specifically ventricular tachycardia (VT). *(Level of Evidence: B)*

2. Incidental finding at electrophysiological study of markedly prolonged HV interval (greater than or equal to 100 milliseconds) in asymptomatic patients. *(Level of Evidence: B) (47)*

3. Incidental finding at electrophysiological study of pacing-induced infra-His block that is not physiological. *(Level of Evidence: B) (54)*

#### Class IIb

1. Neuromuscular diseases such as myotonic muscular dystrophy, Kearn-Sayre syndrome, Erb's dystrophy (limb-girdle), and peroneal muscular atrophy with any degree of fascicular block with or without symptoms, because there may be unpredictable progression of AV conduction disease. *(Level of Evidence: C) (11–17)*

#### Class III

1. Fascicular block without AV block or symptoms. *(Level of Evidence: B) (41,43,46,47)*

2. Fascicular block with first-degree AV block without symptoms. *(Level of Evidence: B) (41,43,46,47)*

#### Comments

No change

Change of "proved" to "demonstrated" because it may be very difficult to prove the cause of syncope.

No change

New Class I recommendation for pacing therapy in patients with neuromuscular diseases and fascicular block. Clinical experience suggests that progression of AV conduction disturbance is unpredictable, and high-grade AV block can develop even in asymptomatic patients with these diseases.

No change

</tr>
</tbody>
</table>

Reworded recommendation to specify that AV block that persists for more than 7 days after cardiac surgery is unlikely to resolve and is best treated with the implantation of a pacemaker. The change was made because of accumulating clinical experience and published studies demonstrating adverse prognosis in such patients who did not receive a permanent pacemaker for rate support.

“Complex ventricular ectopy” was added to the other elements of this recommendation to reflect growing experience that in this setting, prognosis is adversely affected by such ectopy in the absence of rate support by a permanent pacemaker.

5. Patients with congenital heart disease and impaired hemodynamics due to sinus bradycardia or loss of AV synchrony. \( \text{Level of Evidence: C} \)

**Class Iib**

2. Congenital third-degree AV block in the asymptomatic infant, child, adolescent, or young adult with an acceptable rate, narrow QRS complex, and normal ventricular function. \( \text{Level of Evidence: B} \) \( \text{91,103} \)

3. Asymptomatic sinus bradycardia in the adolescent with congenital heart disease with resting heart rate less than 40 bpm or pauses in ventricular rate more than 3 seconds. \( \text{Level of Evidence: C} \)

4. Neuromuscular diseases with any degree of AV block (including first-degree AV block), with or without symptoms, because there may be unpredictable progression of AV conduction disease.

**Class Iib**

2. Congenital third-degree AV block by clinical consensus.

3. Asymptomatic sinus bradycardia in the adolescent with congenital heart disease with resting heart rate less than 40 bpm or pauses in ventricular rate more than 3 seconds. \( \text{Level of Evidence: C} \)

4. Neuromuscular diseases with any degree of AV block (including first-degree AV block), with or without symptoms, because there may be unpredictable progression of AV conduction disease.

**Class Iib**

2. Congenital third-degree AV block by clinical consensus.

3. Asymptomatic sinus bradycardia in the adolescent with congenital heart disease with resting heart rate less than 40 bpm or pauses in ventricular rate more than 3 seconds. \( \text{Level of Evidence: C} \)

4. Neuromuscular diseases with any degree of AV block (including first-degree AV block), with or without symptoms, because there may be unpredictable progression of AV conduction disease.

**Class Iib**

2. Congenital third-degree AV block by clinical consensus.

3. Asymptomatic sinus bradycardia in the adolescent with congenital heart disease with resting heart rate less than 40 bpm or pauses in ventricular rate more than 3 seconds. \( \text{Level of Evidence: C} \)

4. Neuromuscular diseases with any degree of AV block (including first-degree AV block), with or without symptoms, because there may be unpredictable progression of AV conduction disease.
1998 Recommendation | 2002 New or Revised Recommendations | Comments
---|---|---
Class III | Class III | Class III
1. Transient postoperative AV block with return of normal AV conduction within 7 days. (Level of Evidence: B) | 1. Transient postoperative AV block with return of normal AV conduction. (Level of Evidence: B) (90,102) | Reworking of this Class III recommendation to eliminate the 7-day window. There is clinical evidence that patients with postoperative AV block who regain normal AV conduction at any time have generally favorable prognosis without pacing.
2. Asymptomatic postoperative bifascicular block with or without first-degree AV block. (Level of Evidence: C) | No change
3. Asymptomatic type I second-degree AV block. (Level of Evidence: C) | No change
4. Asymptomatic sinus bradycardia in the adolescent with longest RR interval less than 3 seconds and minimum heart rate more than 40 bpm. (Level of Evidence: C) (104) | No change

SECTION I-H: PACING IN SPECIFIC CONDITIONS

1. HYPERTROPHIC OBSTRUCTIVE CARDIOMYOPATHY

Pacing Recommendations for Hypertrophic Cardiomyopathy

Class I | Class I | Class I
1. Class I indications for sinus node dysfunction or AV block as previously described. (Level of Evidence: C) | No change

Class IIb
1. Medically refractory, symptomatic hypertrophic cardiomyopathy with significant resting or provoked LV outflow obstruction. (Level of Evidence: C) | No change in recommendation class. Level of evidence raised from “C” to “A” on the basis of published trials.

Class III
1. Patients who are asymptomatic or medically controlled.
2. Symptomatic patients without evidence of LV outflow obstruction. | No change

SECTION I-H: PACING IN SPECIFIC CONDITIONS (continued)

2. IDIOPATHIC DILATED CARDIOMYOPATHY

Pacing Recommendations for Dilated Cardiomyopathy

Class I | Class I | Class I
1. Class I indications for sinus node dysfunction or AV block as previously described. (Level of Evidence: C) | No change

Class IIA
1. Biventricular pacing in medically refractory, symptomatic New York Heart Association (NYHA) class III or IV patients with idiopathic dilated or ischemic cardiomyopathy, prolonged QRS interval (greater than or equal to 130 ms), LV end-diastolic diameter greater than or equal to 55 mm and ejection fraction less than or equal to 35%. (Level of Evidence: A) (111,112) | New recommendation for biventricular pacing in patients with advanced heart failure, specific indices of LV dysfunction, and prolonged QRS duration. Multiple trials have demonstrated clinical and structural cardiac improvement with this form of therapy.
### SECION I-H: PACING IN SPECIFIC CONDITIONS (continued)

#### 3. CARDIAC TRANSPLANTATION

**Pacing Recommendations After Cardiac Transplantation**

</tr>
<tr>
<td>3. Syncope of undetermined origin with clinically relevant, hemodynamically significant sustained VT or VF induced at electrophysiologial study when drug therapy is ineffective, not tolerated, or not preferred. <em>(Level of Evidence: B)</em> <em>(127,133,135–140)</em></td>
<td>No change</td>
<td></td>
</tr>
</tbody>
</table>
1998 Recommendation | 2002 New or Revised Recommendations | Comments
--- | --- | ---
4. Nonsustained VT with coronary disease, prior MI, LV dysfunction, and inducible VF or sustained VT at electrophysiological study that is not suppressible by a Class I antiarrhythmic drug. *(Level of Evidence: B)* | 4. Nonsustained VT in patients with coronary disease, prior myocardial infarction (MI), LV dysfunction, and inducible VF or sustained VT at electrophysiological study that is not suppressible by a Class I antiarrhythmic drug. *(Level of Evidence: A)* *(141–143)* | No substantive change. Level of evidence raised from "B" to "A" as a result of newly published studies.

**Class IIa**

5. Spontaneous sustained VT in patients who do not have structural heart disease that is not amenable to other treatments. *(Level of Evidence: C)*

**Class IIa**

Patients with LV ejection fraction of less than or equal to 30%, at least one month post myocardial infarction and three months post coronary artery revascularization surgery. *(Level of Evidence: B)* *(159)* | New recommendation for ICD implantation in patients with sustained VT and structurally normal hearts when alternative treatments have failed (See #2 above)

**Class IIb**

1. Cardiac arrest presumed to be due to VF when electrophysiological testing is precluded by other medical conditions. *(Level of Evidence: C)* *(124,131,144,145)* | 2. Severe symptoms (eg, syncope) attributable to ventricular tachyarrhythmias while awaiting cardiac transplantation. *(Level of Evidence: C)* *(146,147)* | No change

**Class IIb**

2. Severe symptoms attributable to sustained ventricular tachyarrhythmias while awaiting cardiac transplantation. *(Level of Evidence: C)* *(146,147)* | No substantive change. Syncope was added as an example of “severe symptoms.”

3. Familial or inherited conditions with a high risk for life-threatening ventricular tachyarrhythmias such as long-QT syndrome or hypertrophic cardiomyopathy. *(Level of Evidence: B)* *(27,39,148–154)* | No change

4. Nonsustained VT with coronary artery disease, prior MI, LV dysfunction, and inducible sustained VT or VF at electrophysiological study. *(Level of Evidence: B)* *(113,118,126,141,142,155,156)* | No change

5. Recurrent syncope of undetermined etiology in the presence of ventricular dysfunction and inducible ventricular arrhythmias at electrophysiological study when other causes of syncope have been excluded. *(Level of Evidence: C)* | No change

6. Syncope of unexplained etiology or family history of unexplained sudden cardiac death in association with typical or atypical right bundle-branch block and ST-segment elevations (Brugada syndrome). *(Level of Evidence: C)* *(157,158)* | New recommendation for ICD implantation in patients with the Brugada syndrome and syncope or family history of sudden cardiac death. Several reports suggest that ICD therapy in patients with this syndrome is effective in preventing sudden death.
