A 67-year-old man with a known dilated cardiomyopathy and a left ventricular ejection fraction of 25% presents to the emergency room with worsening shortness of breath and lightheadedness. His heart rate is 30 bpm and his blood pressure is 90/50 mmHg. His ECG shows complete heart block with an escape junctional rhythm. As a result of his heart failure and low left ventricular ejection fraction it is decided to use a pacing implantable cardioverter-defibrillator. Post insertion an ECG is obtained (ECG A).

The patient returns for a follow-up device check one week later and an ECG is repeated (ECG B).

What is the diagnosis?
To submit your diagnosis, go to http://circ.ahajournals.org/letters/submit/circulationaha;132/13/1283. The diagnosis will follow in the October 6 issue.
Please go to the journal’s Facebook page for more ECG Challenges: http://goo.gl/cm4K7. Challenges are posted on Tuesdays and Responses on Wednesdays.
